Hobbies: Formula 1, Motorsport, Fashion, ML/AI, Building projects, Cinema & Travel.

Languages: Native in Spanish, C1 in English, B1 in Italian and Native in Catalan.

WHO I AM?

• Hi, I'm Marc, great to meet you. What I enjoy most is the moment a technical idea turns into something a business genuinely needs, that's the thread running through everything I've built, from R&D projects at EY to the AI systems I ship today. At Fermat, I grew from Junior AI/ML Engineer into a newly created AI Systems Engineer role, working directly with the CEO to find the inefficiencies holding teams back and build the systems that fix them, exactly where tech and business meet, which is where I do my best work. Outside work, that same curiosity goes into Formula 1: it's behind my BSc thesis, and Pit Wall Engineer, my own project that turns F1 data into the kind of read a race engineer would actually run. I care about teams that talk openly, move fast without cutting corners, and treat learning as part of the job.

EDUCATION

- **Computer Science in Software Engineering**, Universitat Politècnica de Catalunya (UPC) FIB.
- Participant in **HackUPC**, building a [project for TravelPerk](#), where teamwork, problem-solving and presenting product skills were essential, delivering a solid **project in just 72h**.
- Creation & Branding, Operations and Supply Chain in **LVMH** Course.
- **International mobility** in **Italy** deepening **Automotive Autonomous Driving Engineering and Machine Learning** complementing my core studies and learning Italian. *(February - July 2025)*

PROFESSIONAL EXPERIENCE

SalaUno Brand, Owner, Barcelona *(August 2022) + info*

• I created a **jewellery brand**. Building it meant: shaping the initial concept, creating the marketing plan, negotiating with partners, learning the business from the ground up, and driving market penetration.

Ernst&Young I+D Software Engineer *(September 2024 - February 2025)*

• I worked across a wide range of projects and clients, evaluating and justifying new R&D software tools, adapting to different stakeholders, and conducting technical research.

Junior AI/ML Engineer in Fermat *(September 2025)*

• I translated product needs into shipped features across the stack, from defining data flows and ML logic to delivering backend services, pipelines, and user-facing functionality, focusing on maintainable implementation, fast iteration, and measurable outcomes.

AI Systems Engineer Lead, Fermat *(June 2026 – present)*

• This department was created for a real need at Fermat, and offered to me for consistently connecting technology with business. I work directly with the CEO to structure and build the internal systems that make the whole company more productive, identifying inefficiencies across teams and shipping the AI automations that solve them. From gathering requirements and proposing direction through to delivery.

PROJECTS / LEADERSHIP EXPERIENCE

• **Pit Wall Engineer**: An F1 post-race strategy dashboard that reads timing and telemetry the way a race engineer would, true pace, tyre degradation, pit stop impact, and a synchronised telemetry replay. With AI race engineers grounded strictly in each session's own computed data.

• **BSc Thesis**: An Adaptive **Software Agent** to analyze **Telemetry and Data** with ML-based Prediction of Real Network Data Traffic with **Kafka**. Useful for a [research paper](#) on the underlying technology. 

• University Coordinator in **Software Project Management & Requirements Engineering**.

• My **Imola Pitlane Project** simulates an F1-inspired "Box, Box" protocol: RSU broadcasts reroute commands to the pitlane on an Imola simulated track, adapting vehicle speed and collision-avoidance.
